# SURFACE WATER SUPPLY OF HAWAII, JULY 1, 1930, TO JUNE 30, 1931

## AUTHORITY FOR INVESTIGATIONS

This volume contains results of measurements of flow made on certain streams and ditches in the Territory of Hawaii during the year ending June 30, 1931. The data presented in this report were collected by the United States Geological Survey in cooperation with the Territory of Hawaii, under the general sanction of the organic law of the Geological Survey (20 Stat. L., p. 394), which contains the following paragraph:

*Provided*, That this officer [the director] shall have the direction of the Geological Survey and the classification of public lands and examination of the geological structure, mineral resources, and products of the national domain.

As water is the most abundant and most valuable of the minerals, the investigation of water resources is authorized under the provision for examining mineral resources. Since the fiscal year ending June 30, 1895, successive appropriation bills passed by Congress have carried the following item:

For gaging the streams and determining the water supply of the United States, and for the investigation of underground currents and artesian wells, and for the preparation of reports upon the best methods of utilizing the water resources.

For the fiscal years ending June 30, 1929, and thereafter the appropriation bills have carried, in addition to the above provisions, the following proviso: "*Provided*, That no part of this appropriation shall be expended in cooperation with States or municipalities except upon the basis of the State or municipality bearing all the expense incident thereto in excess of such an amount as is necessary for the Geological Survey to perform its share of general water resources investigations, such share of the Geological Survey in no case exceeding 50 per centum."

The Legislature of the Territory of Hawaii approved on March 22, 1909, "An act to promote the conservation and development of the natural resources of the Territory," which provided in substance as follows: A special tax of 2 per cent shall be levied, assessed, and collected annually on all incomes in excess of \$4,000; and all amounts so collected shall constitute a special fund to be expended only for the encouragement of immigration and the conservation of natural

resources in the proportion of three-fourths for immigration and one-fourth for conservation. The conservation fund shall be used for the development, conservation, improvement, and utilization of the natural resources and shall be available for expenditure at such times and in such manner as a board of three persons appointed in accordance with section 80 of the organic act shall, with the approval of the governor, determine.

An act of April 26, 1911, amended the original act so as to extend it until December 31, 1913.

On April 4, 1913, the Governor of the Territory of Hawaii approved Act 56, for the creation and maintenance of a division of hydrography under the board of agriculture and forestry, and Act 57, appropriating the revenues from water licenses for the use of the board of commissioners of agriculture and forestry toward forest protection and hydrographic surveying.

Since June 30, 1915, the funds for the use of the division of hydrography have been supplied by successive appropriations from the general revenues of the Territory.

On March 23, 1917, an act (Act 27) by the Legislature of the Territory of Hawaii was approved transferring the control of the division of hydrography from the board of commissioners of agriculture and forestry to the commissioner of public lands.

## COOPERATION

### COOPERATION WITH THE TERRITORY OF HAWAII

Under the authority conferred by the Federal and Territorial legislation, the Director of the United States Geological Survey and the Governor of the Territory of Hawaii entered into a cooperative agreement, dating from July 1, 1910, for "the gaging of streams and the determination of the water supply of the Territory of Hawaii."<sup>1</sup>

The principal features of this agreement were:

1. The United States Geological Survey assumed the responsibility of gathering, analyzing, and publishing the data.
2. During the progress of the work all notes, maps, and data gathered as a result of field studies were at all times open to inspection by the representative of the Territory, and if they were not satisfactory the agreement could be terminated.
3. Accounts for payment of salaries, travel, and subsistence, supplies, or other expenses necessary to the completion of the work should be rendered in the manner required by the laws and regulations of the contracting parties, and vouchers should be proffered to either party for payment according as it might be convenient or according to the balance remaining in the respective allotments.

---

<sup>1</sup> The United States Geological Survey also cooperated with the Territory of Hawaii in mapping the eight main islands.

4. The cost of publication was borne entirely by the Geological Survey.

In July, 1930, a new cooperative agreement for "the investigation of the water resources of the Territory of Hawaii during the fiscal year July 1, 1930, to June 30, 1931" was entered into, in which the amounts of money to be contributed by each party were specifically stated, these amounts to include the cost of publication; and which provided that "expenses incurred in the performance of the work herein provided shall, so far as may be practicable, be paid in the first instance by the party of the first part with appropriate reimbursement thereafter by the party of the second part, all accounts to be rendered in conformity with the laws and regulations of the party of the second part."

The provisions regarding responsibility for and supervision of the collection of the data, availability of records, etc., however, remained essentially the same.

A similar cooperative agreement was made for the fiscal year 1931-32, differing from that of 1930-31 chiefly in the amounts of money to be spent.

Unless otherwise stated, all data in this paper have been collected and are published under these later cooperative agreements with the Territory of Hawaii.

Until June 30, 1913, the Territory of Hawaii was represented in the cooperation by the board of conservation; from July 1, 1913, to March 23, 1917, by the board of commissioners of agriculture and forestry; and since this date by the commissioner of public lands.

#### OTHER COOPERATION

Some of the data in this paper have been obtained in cooperation with the City and County of Honolulu, the city of Hilo, and private persons and corporations, under one of the plans indicated in the following paragraphs:

1. Expense of work, equipment, and installation paid entirely or in part by the cooperating party.
2. Records collected by employees of a cooperating party but under supervision of and by methods of the Survey.
3. Assistance given in the collection of records, such as furnishing transportation, subsistence, and equipment.
4. Records furnished by a cooperating party, collected by his methods and under his supervision.

Cooperation in the collection of records for whose accuracy responsibility has not rested with the Geological Survey has been acknowledged in the descriptions of the stations. Special acknowledgment is due to the following organizations cooperating under plans 1, 2, and 3: Island of Kauai—Kekaha Sugar Co., McBryde Sugar Co., Gay

& Robinson, East Kauai Water Co., B. P. Bishop Estate, and American Factors (Ltd.); Island of Oahu—City and County of Honolulu, Board of Water Supply, B. P. Bishop Estate, and Wahiawa Water Co.; Island of Maui—Pioneer Mill Co. and East Maui Irrigation Co.; Island of Hawaii—Hilo Waterworks, and Kohala Ditch Co.

### SCOPE OF WORK

Since the beginning of stream-gaging work in Hawaii in 1910, records of flow of streams and ditches have been obtained at about 425 stations for periods ranging from a few months to 22 years. In addition hundreds of miscellaneous measurements have been made, and rather extensive studies of ground water have been made in Kau, Hawaii, and in Honolulu, Oahu.

In this volume are given the records of daily flow that were obtained at the 83 stations that were operated during the year ending June 30, 1931, and the results of miscellaneous measurements of stream flow made during that year. The results of ground-water studies will be published in separate water-supply papers. (See p. 7 for a record of other water-supply papers pertaining to Hawaii.)

### DEFINITION OF TERMS

The volume of water flowing in a stream—the “run-off” or “discharge”—is expressed in various terms, each of which has become associated more or less definitely with a certain class of work. These terms may be divided into two groups: (1) Those that represent a rate of flow, as “second-feet,” “gallons a minute,” “gallons a day,” “miner’s inches,” and “run-off in second-feet a square mile,” and (2) those that represent the actual quantity of water, as “run-off in inches,” “million gallons,” and “acre-feet.” Those used in this report may be defined as follows:

“Second-foot” is an abbreviation for cubic foot a second and is the unit for the rate of discharge of water flowing in a stream 1 square foot in cross section at a rate of 1 foot a second. It is generally adopted as the fundamental unit in the measurement of flowing water and is the “natural” unit, as the foot and the second are the units used in making the physical determinations.

An “acre-foot” is equivalent to 43,560 cubic feet and is the quantity required to cover an acre to the depth of 1 foot. The term is commonly used in connection with storage for irrigation.

In the Territory of Hawaii the unit most commonly used in measuring water is the “million gallons.” This is used with two meanings—(1) to indicate a rate of flow and (2) to express an actual quantity of water. In the former sense “million gallons a day” is inferred, 1,000,000 gallons being taken as the unit of quantity and 24 hours as the unit of time. With this meaning the term is gen-

erally used in connection with pumping and irrigation. In the latter sense "million gallons" as an absolute quantity is used in the measurement of storage capacities of reservoirs.

The following convenient approximate relations exist between second-feet, million gallons a day, and acre-feet; 1 second-foot flowing 24 hours equals about 2 acre-feet; 1,000,000 gallons equals about 3 acre-feet; and 1 second-foot equals approximately two-thirds of 1,000,000 gallons a day.

The following terms not in common use are here defined:

"Stage-discharge relation," an abbreviation for the term "relation of gage height to discharge."

"Control," a term used to designate the natural section or stretch of the channel or artificial structure below the gage which determines the stage-discharge relation at the gage.

The "point of zero flow" for a gaging station is that point on the gage—the gage height—at which water ceases to flow over the control.

#### EXPLANATION OF DATA

The base data collected at gaging stations consist of records of stage, measurements of discharge, and general information used to supplement the gage heights and discharge measurements in determining the daily discharge. The records of stage used in computing discharges in this paper are obtained from water-stage recorders that give continuous records of the fluctuations. Measurements of discharge are made with a current meter by the general methods outlined in standard textbooks on the measurement of river discharge. Occasionally discharge is determined from a weir or a rating flume, using standard formulas. Rating tables giving the discharge for any stage are prepared from the discharge measurements. The application of the daily gage heights to these rating tables gives the discharge from which the daily, monthly, and yearly discharges are determined.

The data presented in this report comprise, for each gaging station, a description of the station, a table showing the daily discharge of the stream, and a table of monthly and yearly discharge and run-off. All rates of flow are expressed as million gallons a day.

The description of the station gives location, drainage area, records available, discharge corresponding to maximum and minimum recorded stages, and, under "Remarks," notes on accuracy of the records, diversions that decrease the flow at the gage, and artificial regulation.

The table of daily discharge gives, in general, the discharge corresponding to the mean daily gage heights. At stations on streams subject to sudden or rapid diurnal fluctuation the discharge obtained from the rating table by applying the mean daily gage height may not be the true mean discharge for the day. At such stations the mean

daily discharge may be obtained by averaging discharges for intervals during the day.

In the table of monthly discharge the column headed "Maximum" gives the flow for the day when the total discharge was greatest. This does not correspond to the rate of flow at the crest of the flood. The maximum rate of flow is given in the station description under the heading "Extremes," and the corresponding stage is always taken from the water-stage recorder graph unless otherwise noted. Likewise, in the column headed "Minimum" the quantity given is the flow for the day when the total discharge was least. The columns headed "Mean" give the average flow in million gallons a day and cubic feet a second during the month. The "total in million gallons" is the sum of the daily flows, and the "total in acre-feet" is computed from the mean monthly discharge in million gallons a day.

#### ACCURACY OF FIELD DATA AND COMPUTED RESULTS

The accuracy of stream-flow data depends primarily (1) on the permanence of the stage-discharge relation, and (2) on the accuracy of observation of stage, measurements of flow, and interpretation of records.

Permanence of the stage-discharge relation will be affected by any change in the control due to growth of vegetation in the stream bed, effects of floods, or any artificial changes, and it may be affected by changes in gage datum.

Observations of stage are taken from the water-stage recorder graphs, with a scale of gage heights so chosen as to give less than 2 per cent of error. However, this accuracy may be interfered with by unsatisfactory operation of water-stage recorders or by plugged or sluggish intakes to stilling wells.

In general, measurements of flow by current meter give less than 5 per cent of error except where it is impossible to find suitable measuring conditions. Rating curves are usually well defined, except for extremely low or high stages, by current-meter measurements and are extended by the use of area and velocity curves, slope measurements, weir tables, logarithmic curves, comparison with previous curves, knowledge of the station, or any combination of these methods.

Unless otherwise noted daily discharges are ascertained by applying to the rating table mean daily gage heights obtained from the recorder graph by inspection or, for days of considerable fluctuation in stage, by averaging discharges for intervals of the day. All computations are carried to not more than three significant figures. The discharges thus obtained are plotted, usually on semi-logarithmic paper, for comparison with the flow of comparable streams, and any inconsistencies that appear are verified or corrected.

A general statement under "Remarks" gives the accuracy of records, based on the above information, the terms "excellent," "good," "fair," or "poor," indicating that the record is probably accurate within 5, 10, 15, and 20 per cent, respectively.

It should be borne in mind that the observations in each succeeding year may be expected to throw new light on data previously published.

### DIVISION OF WORK

The data were collected and prepared for publication under the direction of M. H. Carson, district engineer, Honolulu, Hawaii, by W. E. Armstrong, office engineer, K. N. Valsvik, K. M. Kelley, Sam Wong, G. E. Ferguson, H. W. Palm, G. T. Hirashima, Kenichi Kawamura, John Kaheaku, P. T. P. Goo, and Miss M. A. Davidson. The manuscript has been prepared by W. E. Armstrong and Sam Wong and reviewed by M. H. Carson.

### PUBLICATIONS

The following table gives by years the numbers of the papers on the surface-water supply of Hawaii containing data from 1903 to 1931, and used in conjunction with the list of stations maintained (see Water-Supply Paper 595) provides a convenient index for finding the data for any station. The data for any particular station will be found in the reports covering the years during which the station was maintained except when publication is delayed, owing to undeveloped rating curves. Occasionally data are revised and republished in later papers. Miscellaneous discharge measurements made during any year at points other than regular gaging stations are published in the paper containing that year's data.

## GAGING-STATION RECORDS

## ISLAND OF KAUAI

## WAIMEA RIVER BELOW KEKAHA DITCH INTAKE, NEAR WAIMEA, KAUAI

LOCATION.—Water-stage recorder in Waimea Canyon, 500 feet below Kekaha Ditch intake and 8 miles by trail north of Waimea.

DRAINAGE AREA.—45.0 square miles.

RECORDS AVAILABLE.—July, 1921, to June, 1931.

EXTREMES.—Maximum discharge during year, 1,490 million gallons a day or 2,310 second-feet Nov. 18 (gage height, 14.0 feet); minimum, 0.06 million gallons a day or 0.9 second-foot May 24, 26-27, 31, June 6-8, 20-23.

1921-1931: Maximum discharge, 2,770 million gallons a day or 4,290 second-feet Dec. 24, 1927 (gage height, 20.40 feet); no flow several days from July to November, 1926, and from November to December, 1929.

REMARKS.—Records good for medium stages; poor for all extremely high and low stages. Kokee Ditch and Kekaha Ditch divert above the station, taking practically all the water at low and medium stages for irrigation near Waimea and Kekaha.

## KOKEE DITCH NEAR WAIMEA, KAUAI

LOCATION.—Water-stage recorder 1,000 feet west of road and 10½ miles north of Waimea.

RECORDS AVAILABLE.—September, 1926, to June, 1931.

EXTREMES.—Maximum discharge during year, 67 million gallons a day or 104 second-feet Dec. 2 (gauge height, 2.67 feet); no flow occasionally when water was turned out of ditch just above weir.

1926-1931: Maximum discharge, 68 million gallons a day or 105 second-feet Dec. 24, 1927, Nov. 4, Dec. 2, 1929 (gauge height, 2.70 feet); no flow occasionally when water was turned out of ditch just above weir.

REMARKS.—Records excellent except those estimated, which are fair. Kokee Ditch, at elevation 3,400 feet, diverts water from all streams tributary to Waimea River, east of and including Mohihi Stream, for irrigation near Kekaha. Regulated by head gates.

## SOUTH FORK OF WAILUA RIVER NEAR LIHUE, KAUAI

LOCATION.—Water-stage recorder one-third of a mile above Wailua Falls and 5 miles northeast of Lihue. Prior to Nov. 18, 1918, station was one-third of a mile further upstream.

DRAINAGE AREA.—22.4 square miles.

RECORDS AVAILABLE.—December, 1911, to June, 1931.

EXTREMES.—Maximum discharge during year, 3,670 million gallons a day or 5,680 second-feet July 31 (gage height, 6.04 feet); minimum, 1.4 million gallons a day or 2.2 second-feet June 14.

1911-1931: Maximum discharge, 29,000 million gallons a day or 44,900 second-feet Jan. 16, 1920 (gage height, 11.25 feet); minimum, 1.2 million gallons a day or 1.9 second-feet May 3, 1926.

REMARKS.—Records good except those for extremely high stages, which are poor. Lihue Ditch and Hanamaulu Ditch divert water above station at elevations of 600 feet and 500 feet, respectively, for irrigation.

LOCATION.—Water-stage recorder  $1\frac{1}{2}$  miles above intake of Kanaha Ditch and  $7\frac{1}{4}$  miles northwest of Lihue.

DRAINAGE AREA.—6.6 square miles.

RECORDS AVAILABLE.—August, 1910, to June, 1931.

EXTREMES.—Maximum discharge during year, 1,520 million gallons a day or 2,350 second-feet Nov. 18 (gage height, 6.03 feet); minimum, 10 million gallons a day or 15.5 second-feet May 9.

1910-1931: Maximum discharge, 3,410 million gallons a day or 5,280 second-feet Dec. 24, 1927 (gage height, 8.46 feet); minimum, about 7.7 million gallons a day or 11.9 second-feet Apr. 27, 1926.

REMARKS.—Records good for ordinary stages, fair for estimated periods, and poor for high stages. Hanalei tunnel discharges water into stream, and the North Wailua Ditch diverts water from stream above station for irrigation.

## MISCELLANEOUS MEASUREMENTS

Measurements of streams and ditches on the island of Oahu at other than regular gaging stations are listed below:

*Miscellaneous discharge measurements on Oahu, 1930-31*

Date	Stream	Tributary to—	Locality	Discharge	
				Second-foot	Million gallons a day
June 4	Wahiawa mauka Ditch.....	-----	Intake near Wahiawa.....	1.02	0.659

NOTE.—There were 133 measurements made by J. F. Kunesh or under his supervision. These measurements are published in supplement to the report of the board of water supply, City and County of Honolulu, to the legislature of the Territory of Hawaii, sixteenth regular session, under the title "Water Resources of the City of Honolulu, 1928-1930."

## ISLAND OF MOLOKAI

## HALAWA STREAM NEAR HALAWA, MOLOKAI

LOCATION.—Water-stage recorder 750 feet below confluence of two main branches and 2 miles above mouth of stream and Halawa schoolhouse.

DRAINAGE AREA.—4.6 square miles.

RECORDS AVAILABLE.—August, 1917, to June, 1931.

EXTREMES.—Maximum discharge during year, 1,130 million gallons a day or 1,750 second-feet Nov. 18 (gage height, 9.95 feet); minimum, 1.2 million gallons a day or 1.9 second-feet June 16.

1917-1931: Maximum discharge, about 1,550 million gallons a day or 2,400 second-feet Mar. 31, 1923 (gage height, 11.65 feet); minimum, 0.8 million gallons a day or 1.2 second-feet Oct. 13-15, 19, 1917.

A maximum discharge greater than 1,550 million gallons a day may have occurred on Jan. 20, 1929.

REMARKS.—Records good for ordinary stages; poor for high stages and estimated period. A 1-inch pipe line diverts water a quarter of a mile above station for the domestic use of Halawa village.

## KOOLAU DITCH AT NAHIKU WEIR, NEAR NAHIKU, MAUI

LOCATION.—Water-stage recorder between Kapaula and Waiohue Streams,  $3\frac{1}{2}$  miles southwest of Nahiku and 4 miles southeast of Keanae.

RECORDS AVAILABLE.—February, 1919, to June, 1931.

EXTREMES.—Maximum discharge during year, 57 million gallons a day or 88 second-feet Aug. 5 (gauge height, 1.70 feet); no flow occasionally when water is shut out of ditch.

1919-1931: Maximum discharge, 58 million gallons a day or 90 second-feet Feb. 25 (gauge height, 1.72 feet); no flow occasionally when intake gates are closed.

REMARKS.—Records excellent except those for extremely low stages and estimated periods, which are good. Regulated by spillways and gates. Koolau Ditch diverts water at elevation 1,200 feet from all streams from Makapipi to Alo.
